Sequence 287, Application PC/TUS0304088

GENERAL INFORMATION:
APPLICANT: Bloozwee Pharmaceuticals, Inc.
APPLICANT: Beigelman, Leonid
TITLE OF INVENTION: RAM Interference Mediated Inhibition of Telomerase Gene
TITLE OF INVENTION: Expression Using Short Interfering RNA (sinA)
TITLE OF INVENTION: Expression Using Short Interfering RNA (sinA)
FILE REFERENCE: 02-708-A (400/080)
CURRENT APPLICATION NUMBER: US 60/396,600

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

Patent No. 5510084

GENERAL INFORMATION:

APPLICANT: Cros, Phillippe

APPLICANT: Allibert, Patrice Andre

APPLICANT: Dalbon, Pascal Thierry

ITLE OF INVENTION: Process for Immobilizing a Nucleic Acid

TITLE OF INVENTION: Fragment by Passive Attachement to a Solid Substrate, the

TITLE OF INVENTION: Solid Substrate thus Obtained and Its Use:

NUMBER OF SEQUENCES: 12

CORRESPONDENCE ADDRESS:

ADDRESSEE: Oliff and Berridge

STREET: 700 S. Washington St.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Sequence 110, Application US/09347114A

Patent No. 6297014

GENERAL INFORMATION:
APPLICANT: Maren T. Scheumer (Inventor)
APPLICANT: Maren T. Scheumer (Inventor)
APPLICANT: Jerome I. Rotter (Inventor)
APPLICANT: Jerome I. Rotter (Inventor)
APPLICANT: Huiýing Yang (Inventor)
TITLE OF INVENTION: Genetic Test to Determine
TITLE OF INVENTION: 0. 6297014-responsiveness to Statin Drug Treatment;
FILE REFERENCE: POY 41878
CURRENT APPLICATION NUMBER: US/09/347,114A

CURRENT FILING DATE: 1999-07-02

NUMBER OF SEQ ID NOS: 110

SEQ ID NO 110

SEQ ID NO 110
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gapa

Sequences shown in AAV41169 to AAV41181 represent antisense
cligonuclectides to the RNA component of human telomerase (RTR). These
antisense oligonuclectides specifically hybridise to a nucleotide
sequence within an accessible region of the hTR, but that does not
component of a sequence within the template region of hTR. These
cligonuclectides may specifically be used for detection of an RNA
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
and providing prognosis for a cancer patient. The inhibitors
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
oligonuclectides can inhibit the telomerase activity level in a cell by
interfering with transcription of the RNA component, decreasing the
half-life of the telomerase RNA component transcripting sesembly
of the RNA component into the telomerase holoenzyme, or inhibiting the
polymerase activity of telomerase. These antisense oligonuclectides can
be used for inhibiting telomerase activity; in both cultured cells and in
cells in vivo. They can be used in therapeutics for treating or
immunosuppression, and for selectively down-requiring specific branches
of the immune system, e.g. a specific subset of T-cells, in
anti-inflammatory therapies or for treating infections by, e.g. yeast,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            component; human telomerase; antisense oligonucleotide; infection;

Sequences shown in AAV41169 to AAV41181 represent antisense
cligonucleotides to the RNA component of human telomerase (hTR). These
antisense oligonucleotides specifically hybridise to a nucleotide
cantisense oligonucleotides specifically by the that does not
compound thin an accessible region of the hTR, but that does not
component of human telomerase in a sample. This is useful for diagnosing
conformation of an RNA
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
component of human telomerase in a sample. This is useful for diagnosing
cancer (especially neuroblastoma, bladder, colon and prostate cancer),
component of human telomerase activity level in a cell by
interfering with transcription of the RNA component, decreasing the
conformation of the telomerase RNA component transcript, inhibiting the
collishing telomerase RNA component transcript, inhibiting the
collishing telomerase activity in both cultured cells and in
cells in vivo. They can be used in therapeutics for treating or
cells in vivo. They can be used in therapeutics for treating or
cells in vivo. They can be used in therapeutics for treating or
cells in vivo. They can be used in therapeutics for treating or
cells in vivo. How can be used in therapeutics for treating or
cells in vivo. How can be used in the saperities and in
cells in vivo. They can be used in the saperities subset of T-cells, in
cells in the immune system, e.g. a specific subset of T-cells, in
cantiliamatory therapies or for treating infections by, e.g. yeast,
corporating cancer, for contraception or sterilisation, for
cantiliamatory therapies or for treating infections by, e.g. yeast,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     modulator; GC6 gene; senescent gene expression;
                              detecting or inhibiting human telomerase, e.g. for treating cancers, contraception, immuno-suppression or treating infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .;

senescence. Recombinant expression vectors comprising a recombinant polymucleotide corresponding to a polymucleotide in a human GG gene, are useful for altering senescent gene expression. The vectors and host cells comprising the protein gene expression. The polymucleotides are useful for modulate senescent gene expression. The polymucleotides are useful for producing the protein, gGG and mucleic acid derivatives. The proteins encoded are useful for raising antibodies specific for pGG6, which are useful for raising antibodies specific comprising pGG6 in complex cell mixtures. The characterization of the polymucleotides enable the identification of therapeutic agents that identify and distinguish between young and senescent cells. This enables treatment of aging diseases induced or exacerbated by cellular senescence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to three polymorphic variants of a rat transcriptional regulatory factor Elf-1 (AAB03199-B03192) and nucleic acids encoding them (AAA61645-A61647). The invention also encompasses the use of Elf-1 for regulating the transcription of a gene in an expression vector. The CDNA encoding rat Elf-1 variant #1 (AAA61645) was isolated using PCR primers (AAA61648-A61649) based on mouse Elf-1 CDNA, and the rat Elf-1 variant #2 and 3# CDNAs (AAA61646-A61647) were subsequently isolated. The Elf-1 CDNA and protein sequences are potentially useful for the prevention and treatment of immunological and allergic diseases mediated by Elf-1. Sequences AAA61648-A61649 represent mouse Elf-1 variant #1 cDNA.
  invention relates to methods for modulating and identifying cellular
                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A transcription regulating factor Elf-1 cDNA and its polymorphism

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal orresponding to the marker is detected from the resultant plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. of the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. corrected to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal cresultant cultures are amplified by using the above primer; (g) signals resultant cultures are amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The mixed for microarray is useful for gene analysis. ABM45357 to ABM45322 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

This invention describes Secale cereale microsatellite markers based on hypervariable genomic segments of Secale cereale and plants of the tribes Triticeae and Poeae. The Microsatellite markers comprise a simple sequence repeat (SSR) marker as sequence tag site (STS), defined by two specific S. cereale defined primers, of mean length 18-26 bases and flanking the microsatellite sequence (MSS). Such markers are useful for genetic analysis of trye, triticale and other species of the tribes. Triticeae and Poeae, e.g. for DNA fingerprinting; identification of varieties; detecting self or cross fertilization; studying similarity and relatedness; characterization of cytological lines, or generally any can relatedness; characterization of cytological lines, or generally any can marking of mono- or poly-genic traits, selection and evaluation of varietal purity or checking culture stages (particularly in hybrid culture methods), purity of propagative materials, success of culture methods), purity of propagative materials, success of culture and hybrids. AAX36902-X36965 represent.PCR primers used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel microsatellite markers (MSM), based on the hypervariable genomic regions of rye (Secale cereale) and of plants from the tribes Triliceae and Poese. MSM, which are new genetic markers for rye and closely related species, are used for genetic analysis and in breeding programs. Typical applications are in DNA fingerprinting; identification of varieties; detection of self and cross pollination; characterization of cytoplasmic lines, and genetic mapping (of mono- or poly-genic traits). MSM show a higher degree of polymorphism than known markers (both within and between different rye varieties and lines); can

                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53129 represent peptides related to human polymorphic
                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                       The specification describes an intercellular adhesion molecule (ICAM)-6 polypeptide. The ICAM-6 polypeptides and polymucleotides can be used for drug screening and developing products for therapy involving intercellular adhesion, e.g. in inflammatory processes. The products can also be used for detection, diagnosis and the production of transgenic animals. PCR primers AAX36170-73 were used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, single nucleotide polymorphism; SNP; genome; gene therapy,

polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the

New modified form of factor VIII, useful for treating hemophilia, has altered binding to low density lipoprotein-related protein, resulting in extended in vivo half-life

Example XI; Page 35; 57pp; German.

This invention describes a novel factor VIII polypeptide (I) with factor VIII:C activity which has a modification in at least one of the A3, C1 and/or C2 domains of the light chain that modifies binding affinity to low density lipoprotein receptor-related protein (LRP). Independent claims are also included for the following: (1) DNA (II) that encodes (I); (2) an expression vector containing (II); (3) transformed cells and their descendants containing (II); (4) recombinant production of (I) by culturing cells of (C); and (5) pharmaceutical composition containing a factor VIII molecule (Ia) with factor VIII:C activity plus an LRP antagonist (III). The products of the invention have antihemophilic activity. (I) has reduced affinity for LRP, a receptor involved in clearance of factor VIII from the blood. (I), optionally formulated with an antagonist of LRP, is used for treatment of coagulation disorders, specifically hemophilia A. It may also be used to treat subjects with

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI0010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                ö
          during or after surgery. Nucleic acid that encodes (i) can be used similarly in gene therapy. The light chain modifications reduce clearance of factor vIII protein from the blood, resulting in longer in vivo half-life (particularly at least 90% greater than wild type) and increased stability, in vivo or in vitro. The modifications do not adversely affect procoagulant activity. This sequence represents a primer used in the construction of the plasmid pC2-m%#518 which contains the Pactor VIII light chain C2 region which is described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytoslie methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a cantral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99999, ABF00010-ABH99999 and ABL00010-ABR82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

Berlin K;

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABE09989, ABF0010-ABE09989 and ABI00010-ABE09998 and ABI00010-ABE09073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPPO at Claim 1, SEQ ID 233118; 29pp + Sequence Listing, German. ftp.wipo.int/pub/published_pct_sequences.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwdet (gil 4732114 [gb] AR129072.1); a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AZ393281 22 bp DNA linear GSS 03-OCT-2000 IM0156H13F Mouse 10kb plasmid UUGCIM library Mus musculus genomic clone UUGCIM0156H13 F, DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5

```
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pMQ2 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  BES36289 47 bp mRNA linear EST 09-AUG-2000 601062681F1 NIH_MGC_10 Homo sapiens cDNA clone IMAGE:3448989 5',

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  유
                                                                                                                                                                                                                                                                                                                                                                                                           (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess: The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMAD2 (gil 4732114 [gb]AR129072.1), a copy.number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

//note="NetCor: PWAZIV; Purified genomic DNA from M. musculus C57BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarces gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored for ampicillin resistance." chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|q13214]qb|hg129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Rm..308, Biomedical Polymers Research Bldg., 20 S. 2030 E., SLC, UT

Coli strain XL10-Gold, T1-resistant, F-"
//note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil 4732114 [gb] AR129072.1); a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

(http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance." 14\ c \qquad 5\ g \qquad 9\ t

J Sequence 169, Application US/09657452A

J Patent No. 6426188

J GENERAL INFORMATION:

APPLICANT: Brett P. Monia

APPLICANT: Broqueline Wyatt

TILE OF INVENTION: ANTISENSE MODULATION OF PHOSPHORYLASE KINASE ALPHA 1 EXPRESSION

FILE REFERENCE: RTS-0125

CURRENT APPLICATION NUMBER: US/09/657,452A

CURRENT PILING DATE: 2000-09-07

NUMBER OF SEQ ID NOS: 178

SEQ ID NO 168
